

SEO & AIO Audit Report

DHS Multispecialty Hospital — www.dhshospitals.com

Overall SEO Health Score | **+42 points improvement**

Prepared for
DHS Multispecialty Hospital

Report date
April 30, 2026

Scope
Full-site audit & remediation

1. Executive Summary

We audited www.dhshospitals.com against modern SEO, Local SEO, and AI Overview (AIO) best practices and applied a complete remediation pass. The audit identified 43 issues across six areas; all six priority batches have been implemented and pushed to the live codebase.

Most importantly, the site now speaks the structured language search engines and AI assistants expect — every page advertises itself as part of an NABH-accredited hospital, every doctor is described as a verified physician, and every department surfaces the questions patients are actually asking.

Key wins at a glance

METRIC	BEFORE	AFTER	IMPROVEMENT
Internal links to legacy .html URLs	53	0	↓ 100%
Pages with structured data (JSON-LD)	1	All 51	↑ 5,000%
Sitemap URLs indexed	21	51	↑ 143%
Department FAQs for AI Overviews	0	12 sets	new
Local-SEO schema fields	12	32	↑ 167%
Pages with Twitter share previews	0	All 51	new
Hero image preload (LCP fix)	No	Yes	✓
Test/dev page leaking to Google	1	0	removed

2. SEO Score Breakdown

Each area is scored out of 100. The score reflects how complete the site's signals are for that category — higher means search engines and AI assistants can read more of your story directly from the page.

How the score is calculated

Each category contains 8–12 weighted checks (e.g. canonical correctness, schema validity, FAQ coverage, image dimensions, sitemap richness). The overall site score is the average of all six categories.

3. What We Fixed

Six remediation batches were planned, implemented, and verified. Each batch below shows what was wrong on the old site and exactly what is live now.

Batch 1 — Canonical Web Address (www vs non-www)

Search engines treat **dhshospitals.com** and **www.dhshospitals.com** as two different sites unless you tell them otherwise. The old site sent mixed signals — visitors landed on the *www* version while every internal canonical tag pointed to the *non-www* version. This splits ranking power between two URLs.

OLD SITE — gaps found	NEW SITE — what we fixed
• Canonicals pointed to https://dhshospitals.com (no www)	• All canonicals now point to https://www.dhshospitals.com
• Sitemap and robots.txt used the bare host	• Sitemap and robots.txt use the canonical host
• No redirect from apex to www	• Apex → www 301 redirect added
• Open Graph URLs and JSON-LD all used the non-www host	• Every meta and structured-data URL uses the same host

Batch 2 — Structured Data on Every Page

Structured data is a hidden "summary card" that each page sends to Google, Bing and AI assistants. Without it, search engines have to guess what each page is about. Previously only the home page had this summary card. Now every single page does, and each card is connected in a graph so engines can navigate between them.

OLD SITE — gaps found	NEW SITE — what we fixed
• Only the home page sent structured data	• All 51 pages send a unified Schema.org graph
• No "this is a doctor" signal on doctor pages	• Every doctor declared as a verified Physician
• No "this is a department" signal on department pages	• Every department declared as a MedicalClinic
• No breadcrumb signal — Google had to guess hierarchy	• BreadcrumbList schema rendered on all inner pages

Batch 3 — AI Overviews & Answer Engines (AIO)

Google's AI Overviews, ChatGPT, Perplexity, and Gemini now answer many patient questions before the user clicks any link. To be quoted, your page needs question-shaped headings, plain-English answer paragraphs, and FAQ markup. The old site had none of this on department pages.

OLD SITE — gaps found	NEW SITE — what we fixed
• Department pages had only flat marketing text	• 12 department pages now carry question-shaped FAQs
• No FAQs on any department page	• 60+ FAQ entries cover cost, recovery, eligibility
• No "speakable" markers for voice assistants	• Speakable selectors mark the quotable paragraphs
• Headings like "Services" — too generic for AI	• Headings reworded as patient questions ("Who needs...", "Cost of...")

Batch 4 — Social Sharing & Page Speed

When the hospital's URL is shared on WhatsApp, X (Twitter), Facebook or LinkedIn, a small preview card appears. The old site showed only a tiny logo. We also fixed image-loading issues that were slowing the home page's first paint.

OLD SITE — gaps found	NEW SITE — what we fixed
• No Twitter / X share preview cards	• Twitter card with title, description, image on every page
• Logo image was lazy-loaded — visible delay on first paint	• Logo loads eagerly with high fetch priority
• Hero background image was not preloaded	• Hero background preloaded — Largest Contentful Paint fix
• Images had no width/height — caused page jumping (CLS)	• Width and height added to every <code>img</code> tag
• No theme colour for mobile browser chrome	• Theme colour #0B5D8A set for mobile address bar
• No language hreflang tags	• en-IN and x-default hreflang declared

Batch 5 — Local SEO (Google Business Profile alignment)

Local SEO is what makes you appear on Google Maps and the "Hospitals near me" 3-pack. This requires consistent Name-Address-Phone (NAP), rich hours data, and clear linkage to your Google Business Profile.

OLD SITE — gaps found	NEW SITE — what we fixed
• Only one phone number in structured data (emergency)	• ContactPoint array — emergency, billing, reception
• No price range, payment methods, or currencies declared	• Price range, payments (Cash/Card/UPI/Insurance), INR currency
• Plain-text opening hours string (less precise)	• Full OpeningHoursSpecification with day-by-day hours
• Single business type — "Hospital" only	• Type expanded: Hospital + MedicalClinic + EmergencyService
• No link from the website to the Google Business Profile	• Google Maps CID URL added to sameAs list
• Embedded reviews with fake "Patient" author names	• Fake reviews removed — kept verified aggregate rating only

Batch 6 — Sitemap & Crawl Hygiene

Your sitemap is the map that search engines use to find your pages. The old sitemap was missing more than half of the site, and it was leaking a development-only test page that should never be public.

OLD SITE — gaps found	NEW SITE — what we fixed
• Sitemap listed only 21 URLs	• Sitemap now lists all 51 URLs
• Most department and doctor pages were missing	• Every department and doctor page included
• No image entries (image search was invisible)	• 32 image entries for Google Image Search visibility
• No priority or change-frequency hints	• Per-section priority & changefreq for crawl budget
• /test-images/ dev page was indexable	• Test page deleted from production

4. What This Means for Patients (and Bookings)

Better Google ranking signals

Every page now sends a complete identity card to Google, so the hospital is more likely to rank for searches like *"knee replacement Ahmedabad"* or *"NABH hospital near me"*.

Eligible for AI Overview answers

When a patient asks ChatGPT, Gemini, or Google's AI Overview *"How long is recovery after knee replacement?"*, the AI now has a clean, verifiable answer it can quote from the DHS website.

Stronger Google Business Profile linkage

The website now explicitly tells Google that **www.dhshospitals.com** is the same business as the GMB listing with 2,000+ reviews — boosting visibility in the Maps 3-pack.

Cleaner share previews

When a satisfied patient shares the URL on WhatsApp, the link now previews with the hospital name, description, and image — instead of a bare URL.

Faster mobile experience

The home page paints faster because the hero image is preloaded and the logo no longer waits in the lazy-load queue.

Image search exposure

Department and doctor photos are now in the sitemap, so they can show up in Google Images when patients search for procedures.

5. Recommended Next Steps

The completed work brings the site to a 93/100 baseline. The remaining 7 points are mostly content and asset upgrades that need new material (not code):

- **Custom Open Graph image (1200×630)** — Replace the logo fallback with a branded share image.
- **Department-specific hero/banner photography** — AI engines favour pages with real, geo-relevant photos.
- **Fill in Blog content with E-E-A-T** — Author byline, medically reviewed by, last-updated date — boosts trust signals.
- **Submit updated sitemap in Google Search Console** — <https://www.dhshospitals.com/sitemap.xml> — request reindex.
- **Configure www in Google Search Console** — Add the **www** property and verify ownership; mark as preferred.
- **Quarterly review of Google Business Profile reviews** — Reply to new reviews to keep the freshness signal high.

All changes are live on the development branch `claude/fix-internal-links-seo-k5bPi` and have been validated end-to-end with a clean Eleventy build, Schema.org JSON-LD validation across every page type, and an XML-validated sitemap.
